國立臺灣大學 109 學年度碩士班招生考試試題

科目： 热力學(A)

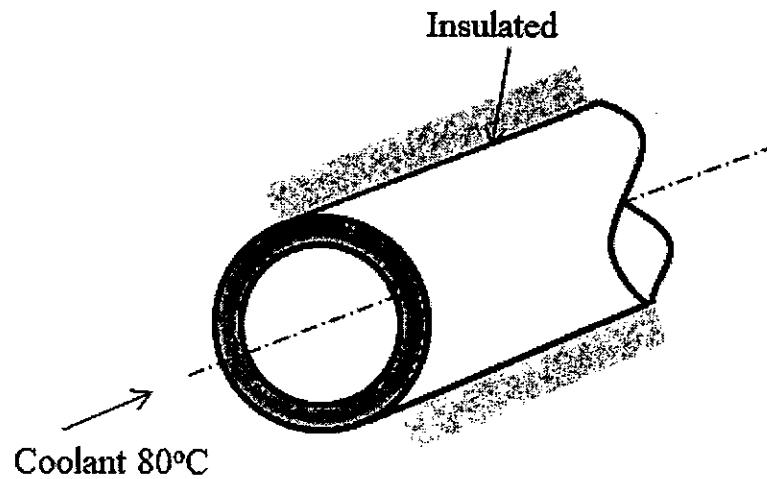

題號： 230

節次： 8

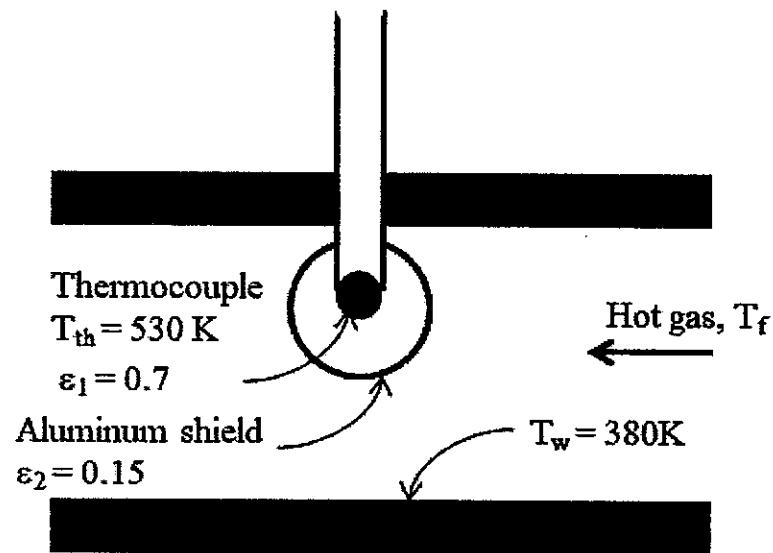

共 4 頁之第 1 頁

Problem 1 (25%) Consider a long solid tube with thermal conductivity of 5 W/m-K, insulated at the outer surface and cooled at the inner surface. The outer radius and inner radius are 20 mm and 25 mm, respectively, and there is uniform heat generation of 5×10^6 W/m³ within the solid. The coolant is at a temperature of 80°C. Determine the convection heat transfer coefficient of the coolant required to maintain the temperature of the outer surface below 350°C.

(Governing equation of heat conduction for cylinders at steady state condition: $\frac{1}{r} \frac{d}{dr} \left(r \frac{dT}{dr} \right) + \frac{\dot{q}}{k} = 0$)

Problem 2 (25%) A thermocouple shielded by aluminum foil of emissivity 0.15 is used to measure the temperature of hot gases flowing in a duct whose walls are maintained at 380 K. The thermometer shows a temperature reading of 530 K. Assuming the emissivity of the thermocouple junction to be 0.7 and convection heat transfer coefficient to be 120 W/m²-K, determine the actual temperature of the gas. (Stefan-Boltzmann constant $\sigma = 5.67 \times 10^{-8} \text{ W/m}^2 \cdot \text{K}^4$)

Problem 3 (16%) Answer the following questions.

- (4%) Write down two reasons to explain why it is impractical to build a household heat pump based on reversed Carnot cycle.
- (4%) Can we derive the first law of thermodynamics from any conservation law(s)? If so, derive it. If not, explain how we get it and why we take it as a theorem.
- (4%) Can we derive the second law of thermodynamics from any conservation law(s)? If so, derive it. If not, explain how we get it and why we take it as a theorem.
- (4%) Is it possible for any device to receive heat from a single reservoir and produce a net amount of work? If so, describe a system that makes this happen. If not, explain why.

Problem 4 (8%) Air is isentropically compressed in a set of piston and cylinder from 100 kPa, 300 K to 1 MPa. Describe how you would determine the final temperature of the air within 1 K using the list of specific heats in the following table 1 (T = temperature; c_p = constant-pressure specific heat; c_v = constant-volume specific heat; $k = c_p/c_v$). DO NOT solve for the final temperature; just write down your algorithm for finding it.

T	K	250	300	350	400	450	500	550	600	650	700	750	800	900	1000
c_p	kJ/kg·K	1.003	1.005	1.008	1.013	1.020	1.029	1.040	1.051	1.063	1.075	1.087	1.099	1.121	1.142
c_v	kJ/kg·K	0.716	0.718	0.721	0.726	0.733	0.742	0.753	0.764	0.776	0.788	0.800	0.812	0.834	0.855
k	--	1.401	1.400	1.398	1.395	1.391	1.387	1.381	1.376	1.370	1.364	1.359	1.354	1.344	1.336

Table 1. Ideal-gas specific heats of air.

Problem 5 (26%) Consider a heat pump running a vapor-compression cycle of R-134a. The machine runs between 100 kPa and 900 kPa and delivers 2 kW of heating power. The cycle is similar to an ideal vapor-compression cycle except the efficiency of the compressor is 80% because the compression process is adiabatic and irreversible.

- (4%) Draw a block diagram of a vapor-compression cycle to illustrate the steady-flow devices of the cycle. Specify the name of each device, the direction in which R-134a flows and from which device(s) heat and work enter and exit the cycle.
- (4%) Draw a T-s diagram with (i) the processes for our heat pump in solid lines and (ii) those of an ideal vapor-compression cycle also running between 100 kPa and 1 MPa in dashed lines. For each process, mark its direction and specify the property (or properties) that remain constant.
- (10%) Determine the temperature and pressure at the beginning of each process. If the initial state of any process is a two-phase mixture, determine the quality of the mixture.
- (3%) Determine the mass flow rate of R-134a. How fast does the heat pump absorb heat? How much power does it consume?
- (5%) What is the lowest efficiency of the compressor if we want the COP to be no less than 3?

Saturated refrigerant-134a—Pressure table
