

1. The following statistics were calculated based on samples drawn from four normal populations:

Statistic	Treatment			
	1	2	3	4
n_j	4	7	5	5
$\sum x_j$	52	69	71	61
$\sum x_j^2$	753	798	1248	912

- Set up the null hypothesis and the alternative hypothesis. (5%)
- What is the variance explained by the different treatments? (5%)
- What is the variance unexplained by the different treatments? (5%)
- Complete the ANOVA table. (8%)
- What is your conclusion for the test? (2%)

2. Bill has collected a set of data on quarterly sales revenues (Y_t , in \$ million) of his Microhard Co. during 2010-2017. Independent variables (explanatory variables) are defined as: X_{t1} = a linear trend variable, starting the first quarter of 2010 = 1; X_{t2} = 1 if period t is the first quarter, 0 otherwise; X_{t3} = 1 if period t is the second quarter, 0 otherwise; and X_{t4} = 1 if period t is the third quarter, 0 otherwise. OLS estimation results of fitting the quarterly sales revenue data are shown as follows:

	Constant	X_{t1}	X_{t2}	X_{t3}	X_{t4}
Parameters	172.34	10.536	57.06	131.29	43.85
	(4.322)	(2.464)	(4.767)	(3.786)	(4.818)

Note: $R^2 = 0.862$; $SSE = 1291.7$; DW statistic = 1.78.

Figures in parentheses are standard deviations.

- Explain the meaning of Durbin-Watson tests (DW statistic) in detail. Perform the test. (10%)
 - Estimate the difference between expected revenues in any third quarter and expected revenues in the following fourth quarter that is attributable to (1) differential seasonal effects; (2) linear trend. (4%)
 - Is the estimate of trend variable significant at the 1% significance level? (6%)
 - Forecast the revenues in the second quarter of 2018. (5%)
3. An urn contains eight red and seven blue balls. A second urn contains an unknown number of red balls and nine blue balls. A ball is drawn from each urn at random, and the probability of getting two balls of the same color is $151/300$. How many red balls are in the second urn? (10%)
4. Let X have a uniform distribution on the interval $(0, 1)$. Given that $X = x$, let Y have a uniform distribution on the interval $(0, x + 1)$.
- Find the joint pdf of X and Y . Sketch the region where $f(x, y) > 0$. (5%)
 - Find $E(Y | x)$, the conditional mean of Y , given that $X = x$. Draw this line on the region sketched in part (a). (5%)
 - Find $f_i(y)$, the marginal pdf of Y . Be sure to include the domain. (5%)
5. Say the serum cholesterol level (X) (血清膽固醇) of Taiwanese males ages 25-34 follows a translated gamma distribution with pdf

$$f(x) = \frac{x-80}{50^2} e^{-(x-80)/50}, \quad 80 < x < \infty$$

- What are the mean and the variance of this distribution? (5%)
- What is the mode? (5%)

c) What percentage have a serum cholesterol level less than 200? (5%)

6. Let $Y_1 < Y_2 < \dots < Y_8$ be the order statistics of eight independent observations from a continuous-type distribution with

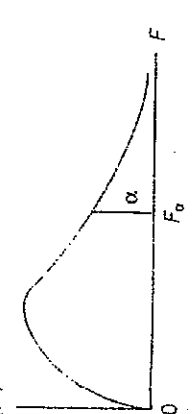

70th percentile $\pi_{0.7} = 27.3$.

a) Determine $P(Y_7 < 27.3)$. (5%)

b) Find $P(Y_5 < 27.3 < Y_8)$. (5%)
